			MAIL DATE	DELIVERY MODE
			08/03/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>
	09/912,403	RAIKE, WILLIAM MICHAEL
	<b>Examiner</b>	<b>Art Unit</b>
	Minh Dieu Nguyen	2137

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

1) Responsive to communication(s) filed on 11 May 2007.

2a) This action is **FINAL**.                    2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

4) Claim(s) 2-5, 9, 11 and 13-16 is/are pending in the application.

4a) Of the above claim(s) 1, 6-8, 10 and 12 is/are withdrawn from consideration.

5) Claim(s) \_\_\_\_\_ is/are allowed.

6) Claim(s) 2-5, 9, 11 and 13-16 is/are rejected.

7) Claim(s) \_\_\_\_\_ is/are objected to.

8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All    b) Some \* c) None of:  
 1. Certified copies of the priority documents have been received.  
 2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

1)  Notice of References Cited (PTO-892)  
 2)  Notice of Draftsperson's Patent Drawing Review (PTO-948)  
 3)  Information Disclosure Statement(s) (PTO/SB/08)  
 Paper No(s)/Mail Date \_\_\_\_\_

4)  Interview Summary (PTO-413)  
 Paper No(s)/Mail Date. \_\_\_\_\_

5)  Notice of Informal Patent Application  
 6)  Other: \_\_\_\_\_

## DETAILED ACTION

### ***Response to Amendment***

1. This office action is in response to the communication dated 5/11/07 with the amendments to claims 2-3, 5, 9, 11 and 16 and the cancellation of 1, 6-8, 10 and 12.
2. Claims 2-5, 9, 11 and 13-16 are pending.

### ***Response to Arguments***

3. Applicant's arguments filed 5/11/07 have been fully considered but they are not persuasive. The Applicant argues that none of the cited references consider the use of packet-specific tags to encrypt data packets. The Examiner respectfully disagrees, as Bleichenbacher discloses, each transmitted program is encrypted using a program key,  $K_p$  (col. 4, line 66-col. 5, line 1). The program key is obtained by recursively applying one or more hash functions to the master key depending on the binary value of the program identifier (col. 5, lines 50-53). The program identifier is specific and unique to each program. As such, Bleichenbacher discloses the recited claimed language (i.e. the packet keys are being based on the random base key and unique packet tags assigned to each data packet).

In response to applicant's arguments against the references individually (i.e. Gammie reference), one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re*

*Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

***Specification***

4. The amendment filed 5/11/07 is objected to under 35 U.S.C. 132(a) because it introduces new matter into the disclosure. 35 U.S.C. 132(a) states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows: "the base key is transmitted by adding it to a header of the transmission".

Applicant is required to cancel the new matter in the reply to this Office Action.

***Claim Rejections - 35 USC § 112***

5. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

6. Claim 2 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. According to the specification, paragraph 0031, the open key (i.e. encrypted base key) is transmitted to the recipient in the stream header, as such

Art Unit: 2137

the amended claim 2 should recite "said **encrypted** base key is transmitted by adding it to a header of the transmission".

***Claim Rejections - 35 USC § 103***

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

8. Claims 4-5, 9, 11, 13 and 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bleichenbacher et al. (6,735,313) in view of Gammie (5,029,207).

a) As to claim 9, Bleichenbacher discloses a method for securely transmitting streaming media (Bleichenbacher: col. 1, lines 9-15) comprising: generating a random base key (e.g. master key, "m", Bleichenbacher: col. 7, lines 20-23); encrypting the streaming media by creating different packet keys (e.g. program keys) for each data packet (e.g. each transmitted program) of the streaming media and encrypting each data packet using the corresponding packet keys (i.e. each transmitted program is encrypted by the server using a program key, which is unique to the program, Bleichenbacher: col. 4, line 66 to col. 5, line 1), the packet keys being based on the random base key and unique packet tags (e.g. program identifier, "p", Bleichenbacher: col. 2, lines 53-65) assigned to each data packet (i.e. a program key,  $K_p$ , is obtained by recursively applying one or more hash functions to the master key, "m", depending on the binary value of the program identifier, "p", Bleichenbacher: col. 5, lines 50-53);

transmitting the encrypted data packets and the unique packet tags to a recipient (Bleichenbacher: col. 6, lines 6-8).

Bleichenbacher is silent on the capability of encrypting the random base key, thus creating an open key and transmitting the open key to a recipient in a transmission separate from the transmission of the encrypted data packets and the unique packet tags to a recipient.

Gammie is relied on for the teaching of encrypting the random base key (e.g. encrypting the key with a first secret serial number of the subscriber's replaceable security module, Gammie: col. 8, lines 32-24), thus creating an open key and transmitting the open key to a recipient in a transmission separate from the transmission of the encrypted data packets and the unique packet tags to a recipient (i.e. the key may be sent over a separate data channel, Gammie: col. 2, lines 10-12; Fig. 7, element 705; col. 12, lines 42-45).

It would have been obvious to one of ordinary skill in the art at the time of the invention to employ the use of encrypting the random base key, thus creating an open key and transmitting the open key to a recipient in a transmission separate from the transmission of the encrypted data packets and the unique packet tags to a recipient in the system of Bleichenbacher, as Gammie discloses, so as to securely protect and restrict access to transmitted multimedia information (Bleichenbacher: col. 1, lines 9-12).

b) As to claim 4, the combination of Bleichenbacher and Gammie discloses the method of claim 9 wherein said packet data is encrypted using a symmetric

algorithm in conjunction with said packet keys (i.e. symmetric algorithm is the same algorithm with the same key is used for encryption and decryption, the program key,  $K_p$ , used to encrypt each transmitted program is based on a secure hash of the base key and unique packet tag, Bleichenbacher: col. 5, lines 50-53, that same program key,  $K_p$ , is obtained to decrypt the received program, Bleichenbacher: col. 6, lines 8-10).

c) As to claim 11, the combination of Bleichenbacher and Gammie discloses the method of claim 9 wherein the packet keys are based on a secure hash of the random base key and unique packet tags assigned to each data packet (i.e. a program key,  $K_p$ , is obtained by recursively applying one or more hash functions to the master key, "m", depending on the binary value of the program identifier, "p", Bleichenbacher: col. 5, lines 50-53).

d) As to claim 5, the combination of Bleichenbacher and Gammie discloses the method of claim 11 wherein the secure hash is based on a hash function selected from the group consisting of SHA-1 and MD5 (Bleichenbacher: col. 5, lines 43-47).

e) As to claim 13, the components of the limitations in this claim (i.e. receiving encrypted streaming media) are similar to those of claim 9 (i.e. transmitting streaming media), this claim is rejected by the same rationale applied against claim 9 above.

Bleichenbacher discloses a method for receiving encrypted streaming media (Bleichenbacher: col. 1, lines 9-15) comprising: receiving an encrypted packet stream, the packet stream comprising a plurality of packets, each packet comprising encrypted packet information and a unique tag value (Bleichenbacher: col. 10, lines 15-17);

extracting the unique tag value from each packet (Bleichenbacher: col. 6, line 8); computing a unique packet key for each packet based on the unique tag value and the decrypted base key (Bleichenbacher: col. 6, lines 9-16) and decrypting the packet information using the corresponding packet keys (Bleichenbacher: col. 6, lines 9-10). Bleichenbacher is silent on the capability of receiving an encrypted base key in a transmission separate from the transmission of the encrypted packet stream and decrypting the base key (as Bleichenbacher is silent on the capability of encrypting the base key as addressed in the above claim 9). Gammie is relied on for the teaching of receiving an encrypted base key in a transmission separate from the transmission of the encrypted packet stream (i.e. the key may be sent over a separate data channel, Gammie: col. 2, lines 10-12; Fig. 7, element 705; col. 12, lines 42-45) and decrypting the base key (Gammie: col. 8, line 58 – col. 9, line 4). It would have been obvious to one of ordinary skill in the art at the time of the invention to employ the use of receiving an encrypted base key in a transmission separate from the transmission of the encrypted packet stream and decrypting the base key in the system of Bleichenbacher as Gammie discloses so as to securely protect access to transmitted multimedia information (Bleichenbacher: col. 1, lines 9-12).

f) As to claim 15, the combination of Bleichenbacher and Gammie discloses the method of claim 13 wherein the computation of the packet keys is based on a secure hash of the base key and unique packet tags assigned to each data packet (i.e. a program key,  $K_p$ , is obtained by recursively applying one or more hash functions

Art Unit: 2137

to the master key, "m", depending on the binary value of the program identifier, "p", Bleichenbacher, col. 5, lines 50-53).

g) As to claim 16, the limitation in this claim is similar to the one of claim 5, thus it is rejected with the same rationale applied against claim 5 above.

9. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Bleichenbacher et al. (6,735,313) in view of Gammie (5,029,207) and further in view of Hawthorne (5,768,381).

Bleichenbacher and Gammie disclose the recited method of claim 13, however they are silent in the capability of transmitting the open key by adding it to a header of the transmission. Hawthorne is relied on for the teaching of transmitting the open key (e.g. encrypted session key) by adding it to a header of the transmission (i.e. transmitting encrypted session key as header to the recipient, Hawthorne: col. 1, lines 6-10).

It would have been obvious to one of ordinary skill in the art at the time of the invention to employ the use of transmitting the open key to the recipient by adding it to the stream header in the system of Bleichenbacher and Gammie, as Hawthorne teaches, so as to strengthen secure communications between two entities.

10. Claims 3 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bleichenbacher et al. (6,735,313) in view of Gammie (5,029,207) and further in view of Stallings (Cryptography and Network Security).

a) As to claim 3, the combination of Bleichenbacher and Gammie discloses the claimed limitations of claim 9, in particular Gammie discloses encrypting the base key (e.g. encrypting the key with a first secret serial number of the subscriber's replaceable security module, Gammie: col. 8, lines 32-24). However they are silent on the capability of the base key is encrypted using a public key encryption algorithm. Stalling is relies on for the teaching of the base key is encrypted using a public key encryption algorithm (i.e. either of the two related keys can be used for encryption, with the other used for decryption, Stallings: pages 165-167).

It would have been obvious to one of ordinary skill in the art at the time of the invention to employ the use of having the base key encrypted using a public key encryption algorithm in the system of Bleichenbacher and Gammie, as Stallings discloses, so as to provide a different means or algorithm of encrypting transmitted information.

b) As to claim 14, the limitation in this claim is similar to the one of claim 3, thus it is rejected with the same rationale applied against claim 3 above.

### **Conclusion**

11. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

12. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Minh Dieu Nguyen whose telephone number is 571-272-3873.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Emmanuel Moise can be reached on 571-272-3865. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
